```
with the corresponding symmetric dual problem, Minimize b^T y subject to A^Ty \ge c, y \ge 0. Maximize c^T x subject to Ax \le b;
     with the corresponding asymmetric dual problem, Minimize \boldsymbol{b}^T y subject to A^T\boldsymbol{y}=c,\boldsymbol{y}{\succeq}0. Minimum vertex cover on bipartite graph =
     Maximum matching on bipartite graph
Minimum edge cover on bipartite graph =
      vertex number - Minimum vertex cover(Maximum matching)
      Independent set on bipartite graph =
     vertex number - Minimum vertex cover(Maximum matching)
找出最小點覆蓋,做完 dinic 之後,從源點 dfs 只走還有流量的
邊,紀錄每個點有沒有被走到,左邊沒被走到的點跟右邊被走
      到的點就是答案
      Maximum density subgraph (\sum W_e + \sum W_v)/|V|
      Binary search on answer:
      For a fixed D, construct a Max flow model as follow:
     Let S be Sum of all weight( or inf)

1. from source to each node with cap = S

2. For each (u,v,w) in E, (u->v,cap=w), (v->u,cap=w)

3. For each node v, from v to sink with cap = S + 2 * D - deg[v] - 2 * 10 | ll fa[MXN], fi[MXN];
     where deg[v] = \sum weight of edge associated with v If maxflow < S * |V|, D is an answer.
      Requiring subgraph: all vertex can be reached from source with
      edge whose cap > 0.
 • Maximum/Minimum flow with lower bound / Circulation problem
1. Construct super source S and sink T.
2. For each edge (x,y,l,u), connect x 	o y with capacity u-l.
2. For each edge (x,y,l,u), connect x\to y with capacity u-l.   
3. For each vertex v, denote by in(v) the difference between the sum of
      incoming lower bounds and the sum of outgoing lower bounds.
4. If in(v)>0, connect S\to v with capacity in(v), otherwise, connect
      v 	o T with capacity -in(v).
 – To maximize, connect t \to s with capacity \infty (skip this in circulation problem), and let f be the maximum flow from S to T. If
 lation problem), and let f be the maximum flow from S to T. If f\neq \sum_{v\in V, in(v)>0} in(v), there's no solution. Otherwise, the maximum flow from s to t is the answer.  
To minimize, let f be the maximum flow from S to T. Connect t\to s^2 with capacity \infty and let the flow from S to T be f'. If f+f'\neq 3 \sum_{v\in V, in(v)>0} in(v), there's no solution. Otherwise, f' is the answer. 4
5. The solution of each edge e is l_e+f_e, where f_e corresponds to the flow ^{\mbox{5}}
     of edge e on the graph.
  - Construct minimum vertex cover from maximum matching {\cal M} on bipartite {\bf g}
     \operatorname{graph}\ (X,Y)
1. Redirect every edge: y \to x if (x,y) \in M, x \to y otherwise.
                                                                                                                               10
2. DFS from unmatched vertices in X.
3. x \in X is chosen iff x is unvisited.
                                                                                                                               11
                                                                                                                               12
4. y \in Y is chosen iff y is visited.
                                                                                                                               13
 • Maximum density induced subgraph
                                                                                                                               14
1. Binary search on answer, suppose we're checking answer T 15 2. Construct a max flow model, let K be the sum of all weights 16 3. Connect source s \to v, v \in G with capacity K 4. For each edge (u,v,w) in G, connect u \to v and v \to u with capacity w 5. For v \in G, connect it with sink v \to t with capacity K + 2T = 17
     (\sum_{e \in E(v)} w(e)) - 2w(v)
```

```
6. T is a valid answer if the maximum flow f < K|V|
```

- 1. For each $v \in V$ create a copy v', and connect u' o v' with weight w(u,v).
- Connect v o v' with weight $2\mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to v.
- 3. Find the minimum weight perfect matching on G^\prime .
- Project selection problem
- 1. If $p_v > 0$, create edge (s,v) with capacity p_v ; otherwise, create edge (v,t) with capacity $-p_v$.
- 2. Create edge (u,v) with capacity w with w being the cost of choosing uwithout choosing v.
- 3. The mincut is equivalent to the maximum profit of a subset of projects.
- 0/1 quadratic programming

$$\sum_{x} c_{x} x + \sum_{y} c_{y} \bar{y} + \sum_{xy} c_{xy} x \bar{y} + \sum_{xyx'y'} c_{xyx'y'} (x \bar{y} + x' \bar{y'})$$

can be minimized by the mincut of the following graph:

- 1. Create edge (x,t) with capacity c_x and create edge (s,y) with capacity
- 2. Create edge (x,y) with capacity c_{xy} .
- 3. Create edge (x,y) and edge (x^\prime,y^\prime) with capacity $c_{xyx^\prime y^\prime}$.

     }
```

```
分組背包
當有分組問題,如買 A 物品前要先買 B 物品。
dp[i] = max(dp[i], dp[i - B - A] + val[B] + val[A])
多重背包
當每種物品為有限個時,求最大價值。
dp[i][j] = max(dp[i][j], dp[i - 1][j - k * w[i]] + k * v[i])
雲要轉換成單調對列優化。
d = j \mod w[i], s = |j/w[i]|
dp[i] = max(dp[d + w[i] * k] - v[i] * k) + v * s
樹上背包
dp(u, i, j) 代表 u 根節點,遍歷 i 個子節點,且體積為 j 的最大價值。
dp(u, i, j) = max(dp(u, i - 1, j - k) + dp(v, s, k))
(s 為 v 子樹的節點數)
數位 DP
1. 要求統計滿足一定條件的數的數量 (即,最終目的為計數)
2. 這些條件經過轉化後可以使用「數位」的思想去理解和判斷
3. 輸入會提供一個數字區間(有時也只提供上界)來作為統計的限制
4. 上界很大(比如 1018),暴力枚舉驗證會超時。
dp[位數][限制 1][限制 2]...
dfs 從高到低
區間 DP
合併:即將兩個或多個部分進行整合,當然也可以反過來
特徵:能將問題分解為能兩兩合併的形式
```

```
部分的最優值得到原問題的最優值
```

```
dp[i][j] = min(dp[i][j], dp[i][k] + dp[k + 1][j] + cost)
SOS DP
= 子集和 DP
```
